

DRAW 2.0.3

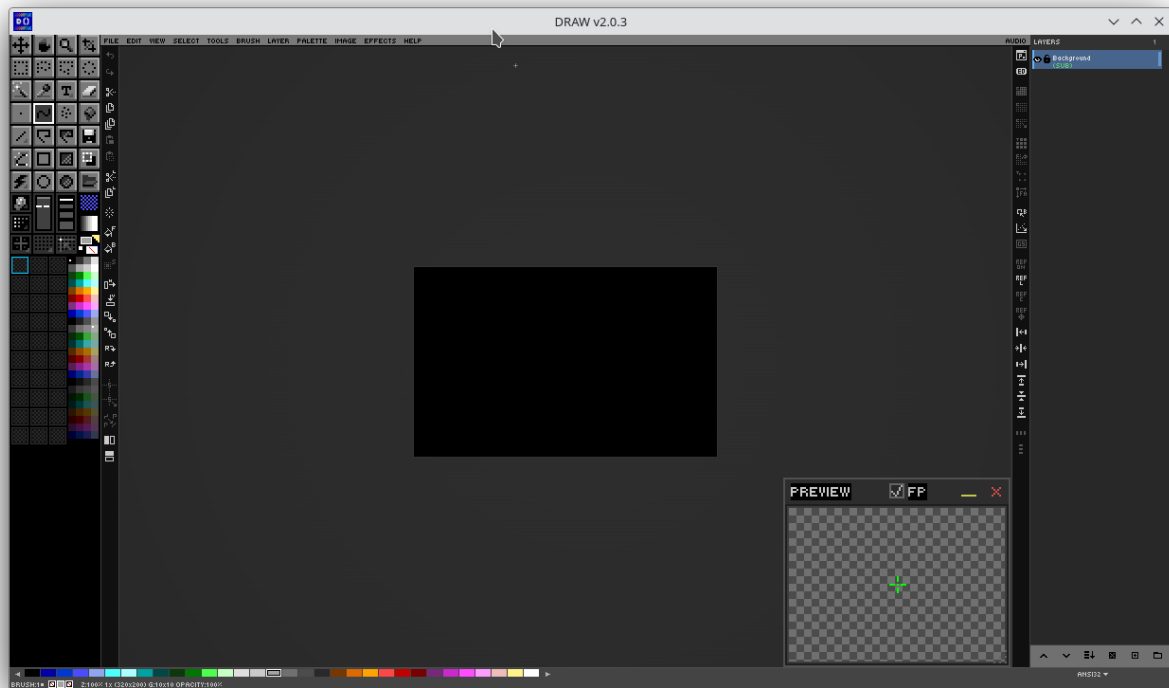

thanks Grymmjack for your beautiful project and your massive effort to refine it.

Feedbacks:

all previous weird behaviour are fixed

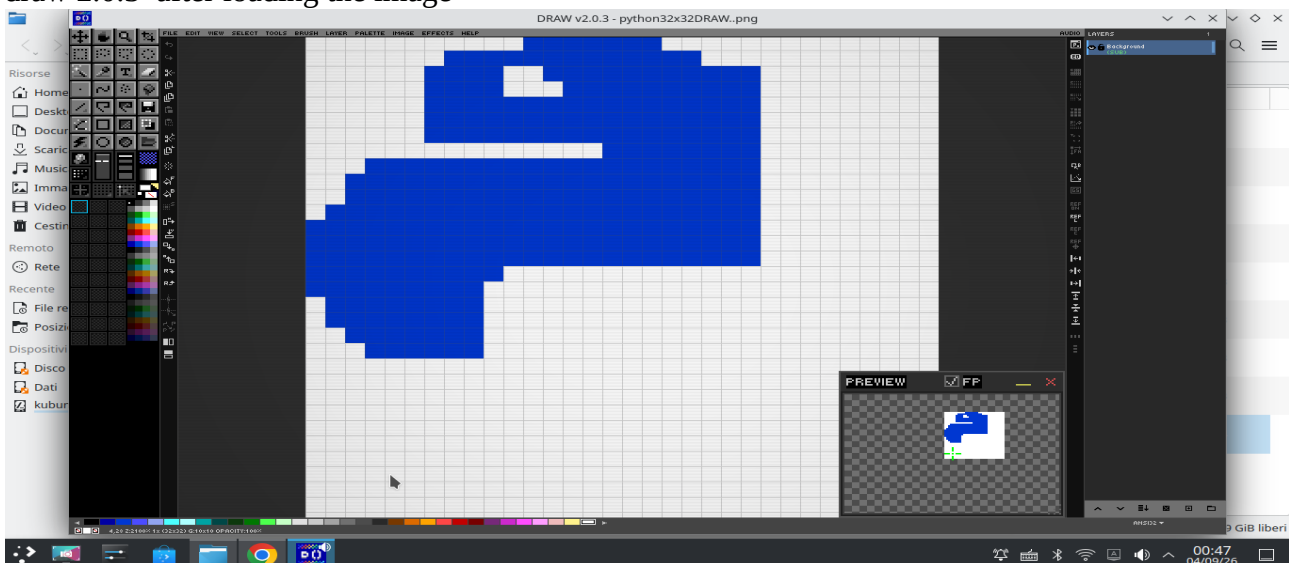

here a screenshot documentation:

draw 2.0.3 at starting time

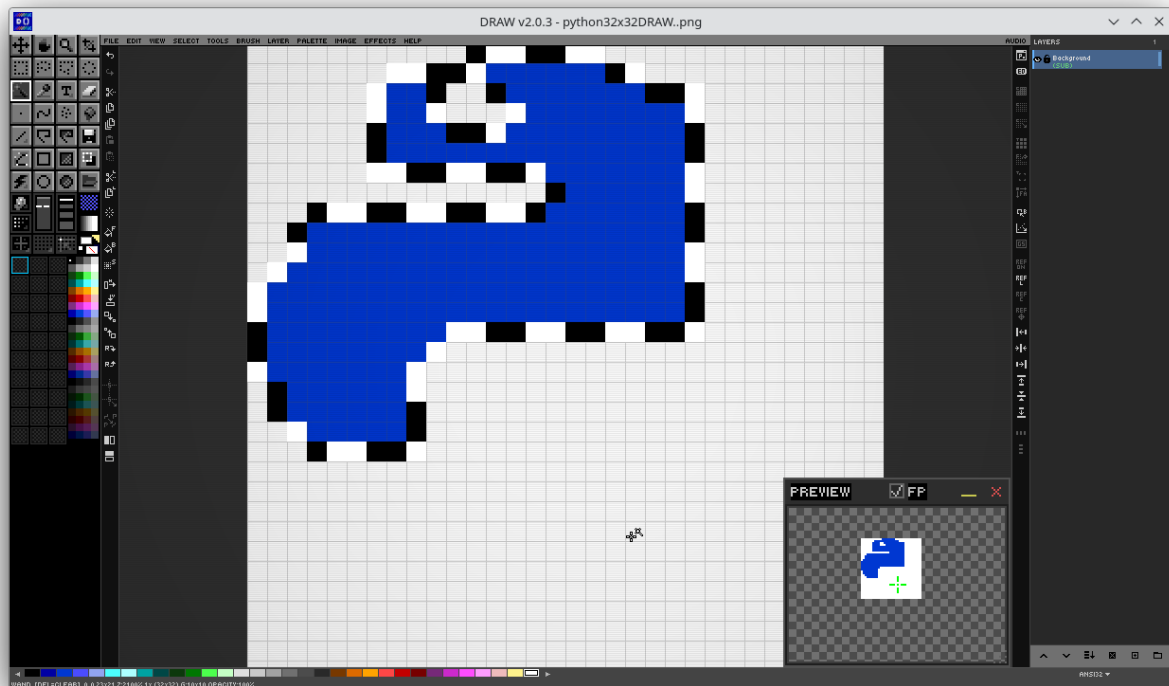

Test 1:

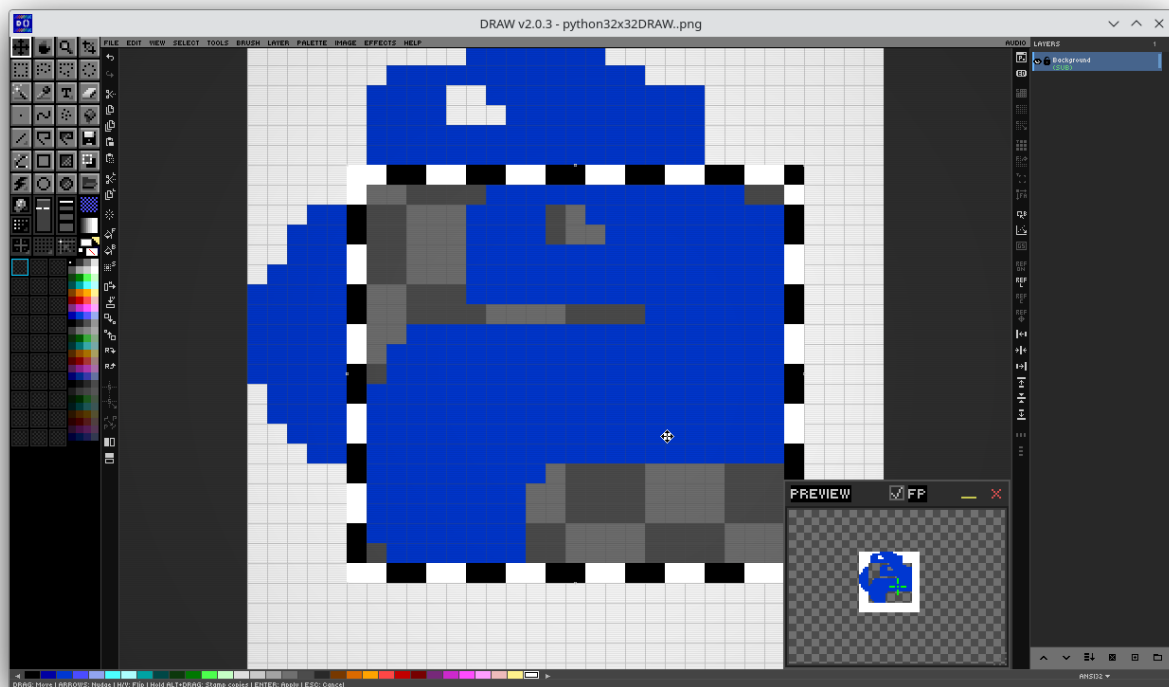

draw 2.0.3 after loading the image

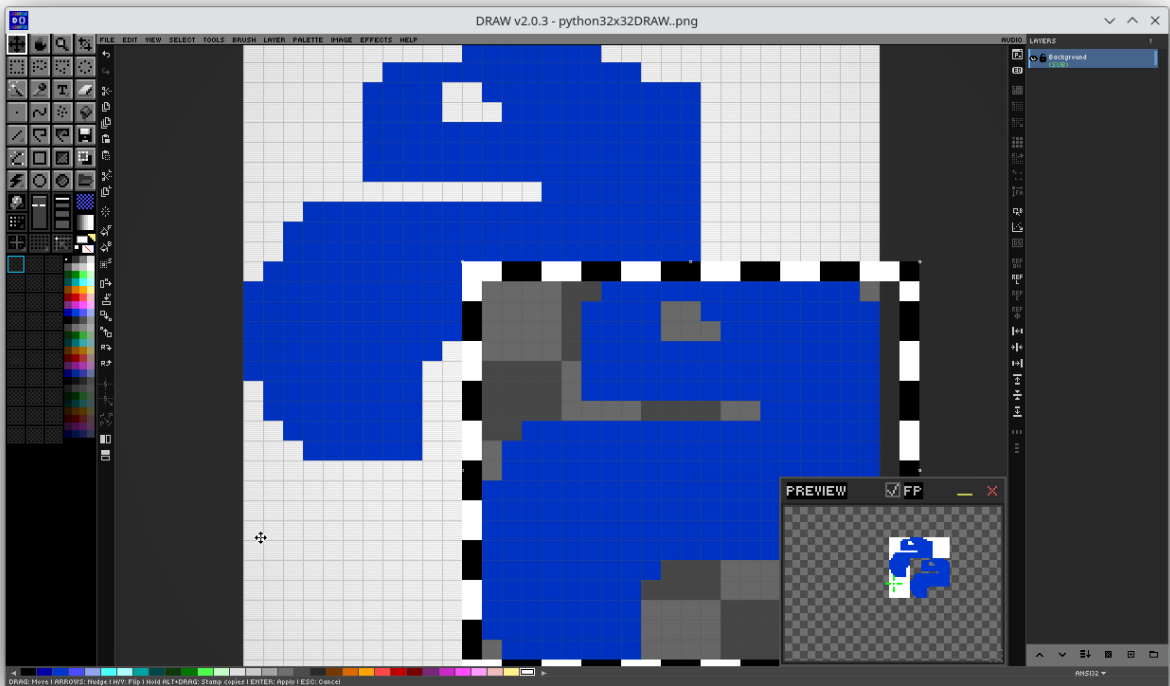

draw 2.0.3 after using **Magic Wand** on a shape selecting it

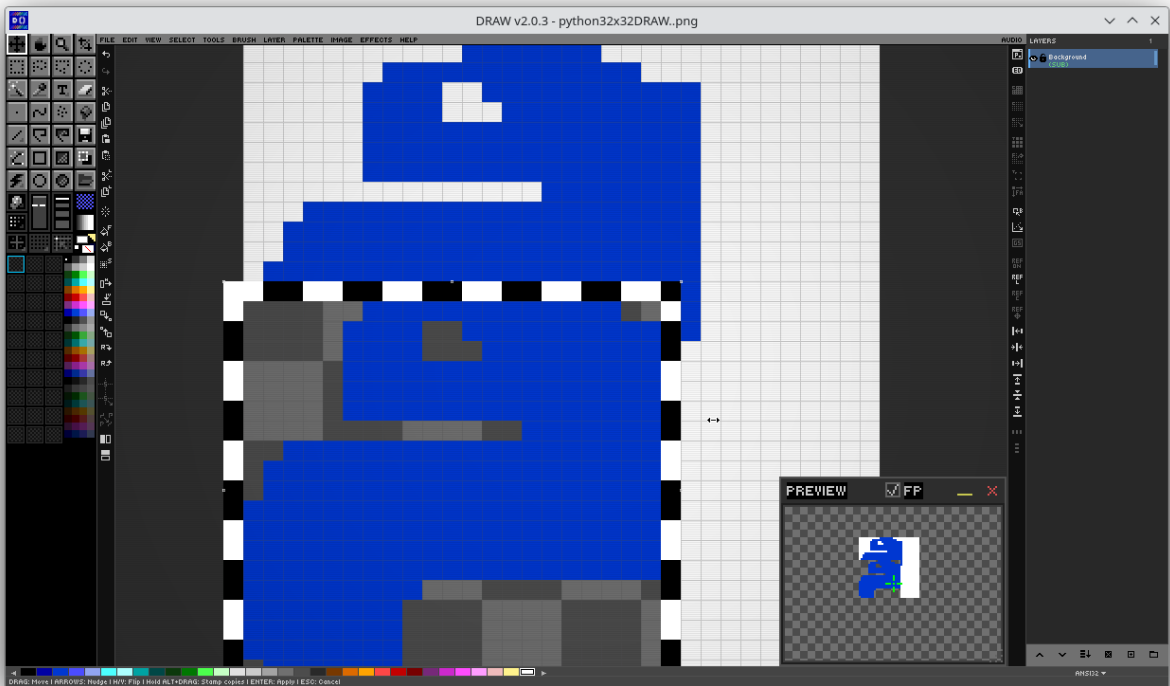

draw 2.0.3 after copy and paste (both via hotkeys, both via menu **Edit**, both in mixed ways)

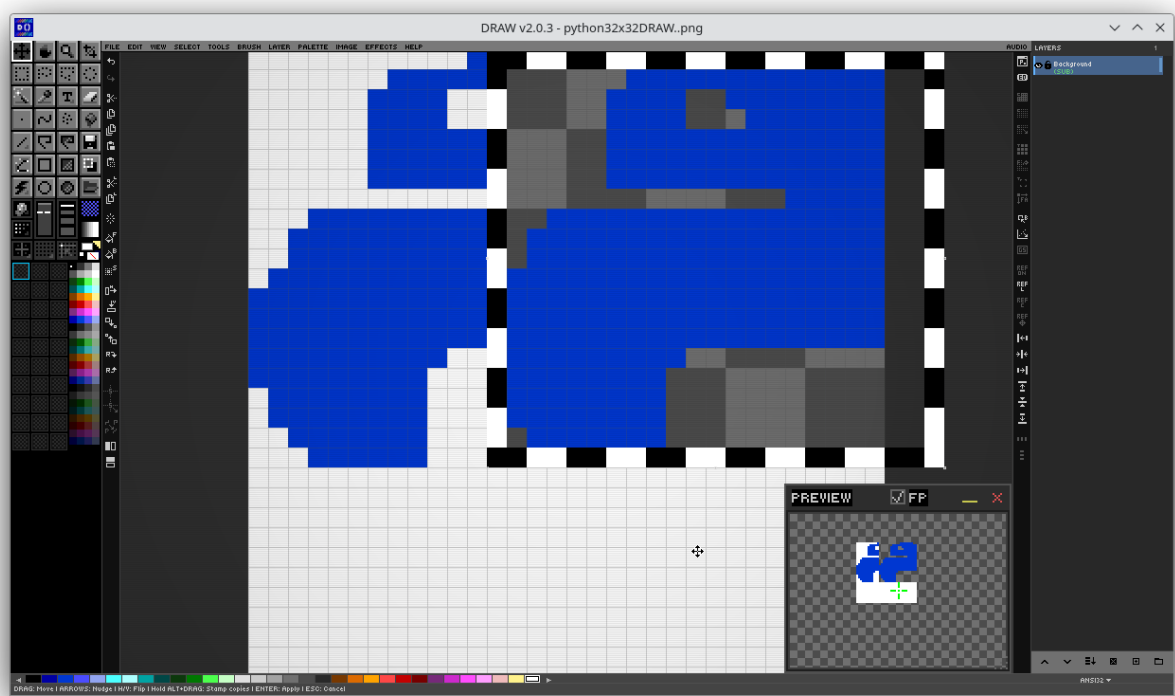

draw 2.0.3 after moving, releasing and moving again (3 times)
the first drag

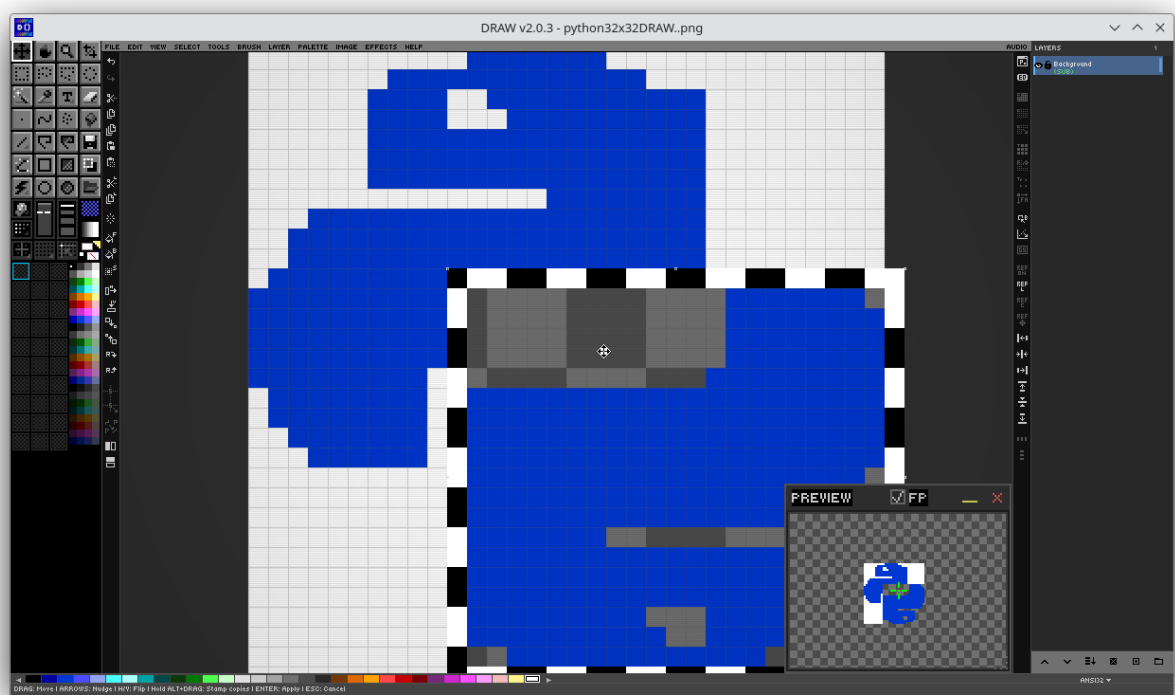

the second drag

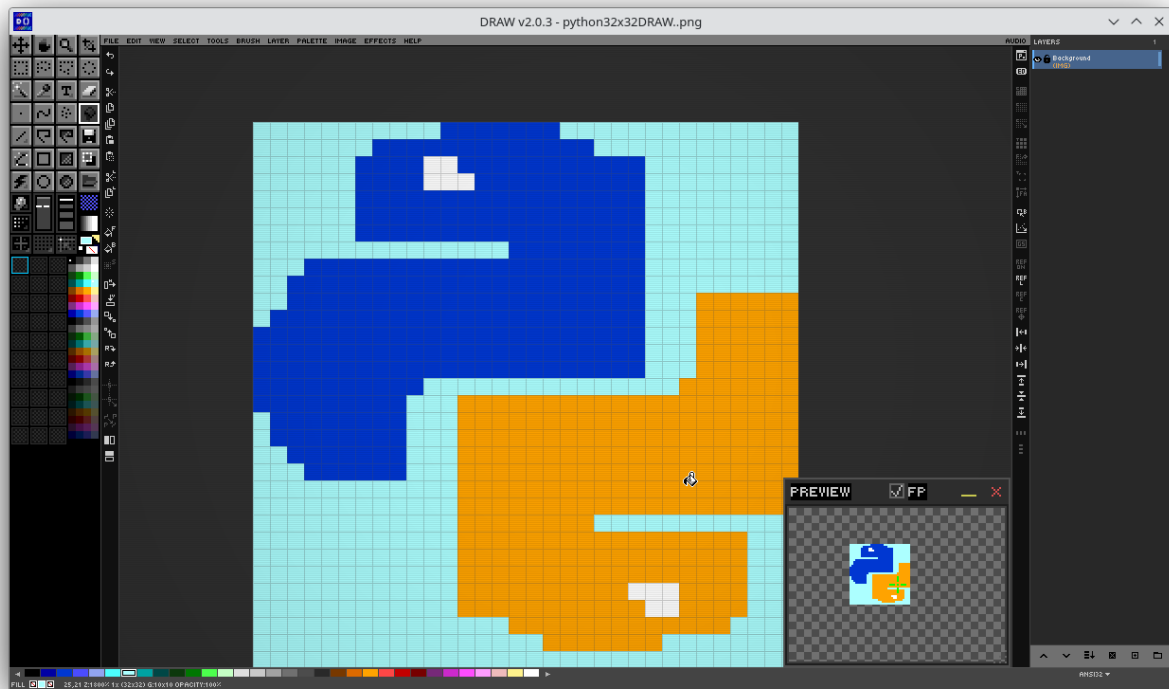

the third drag

draw 2.0.3 after positioning the image, it performs G e V for flipping orizontal and vertical the selected area

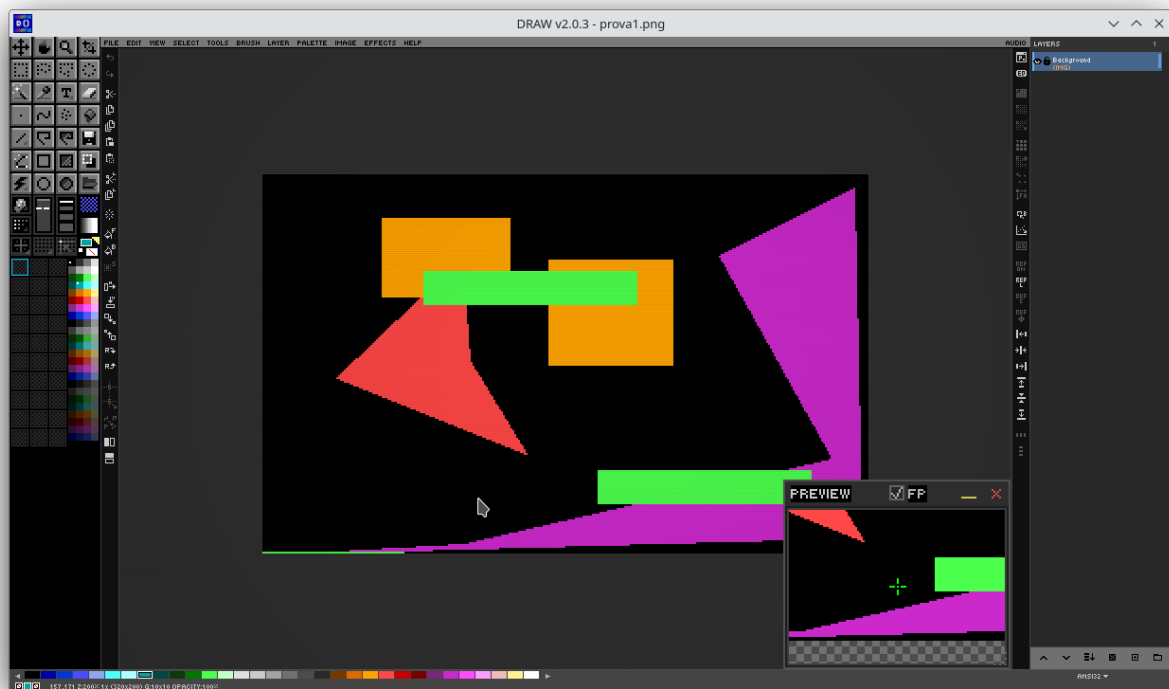

draw 2.0.3 after deselecting the area copied, using F and B tools

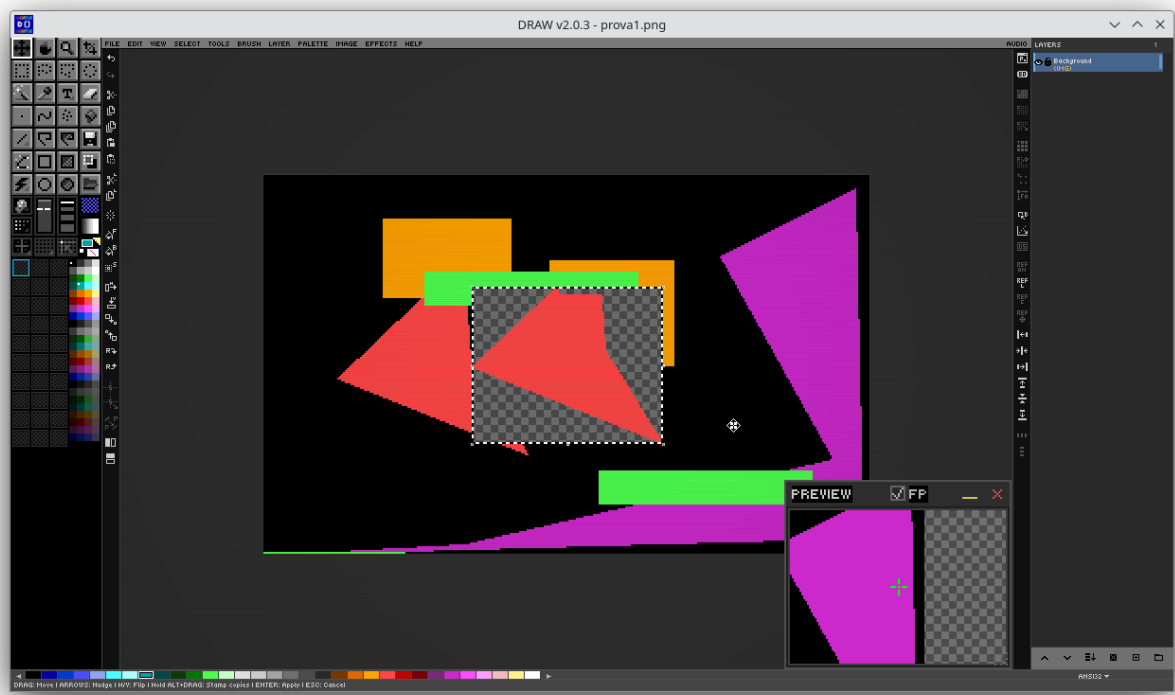

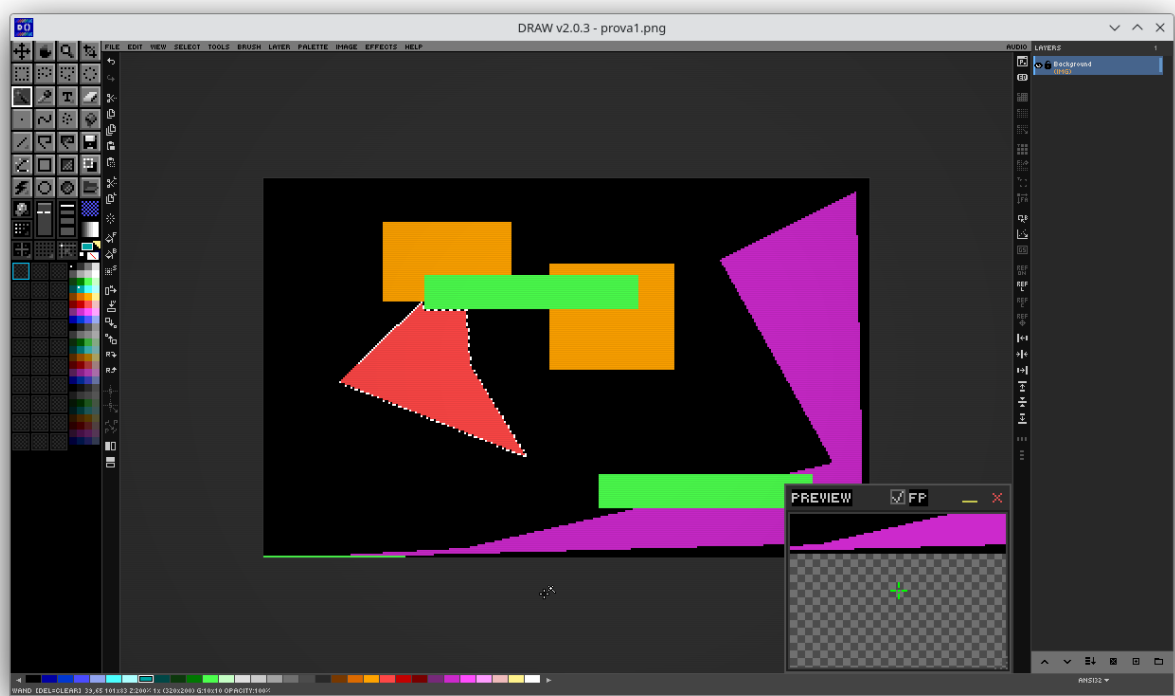

Test 2

in the same sequence here the screenshots of a second test with draw 2.0.3

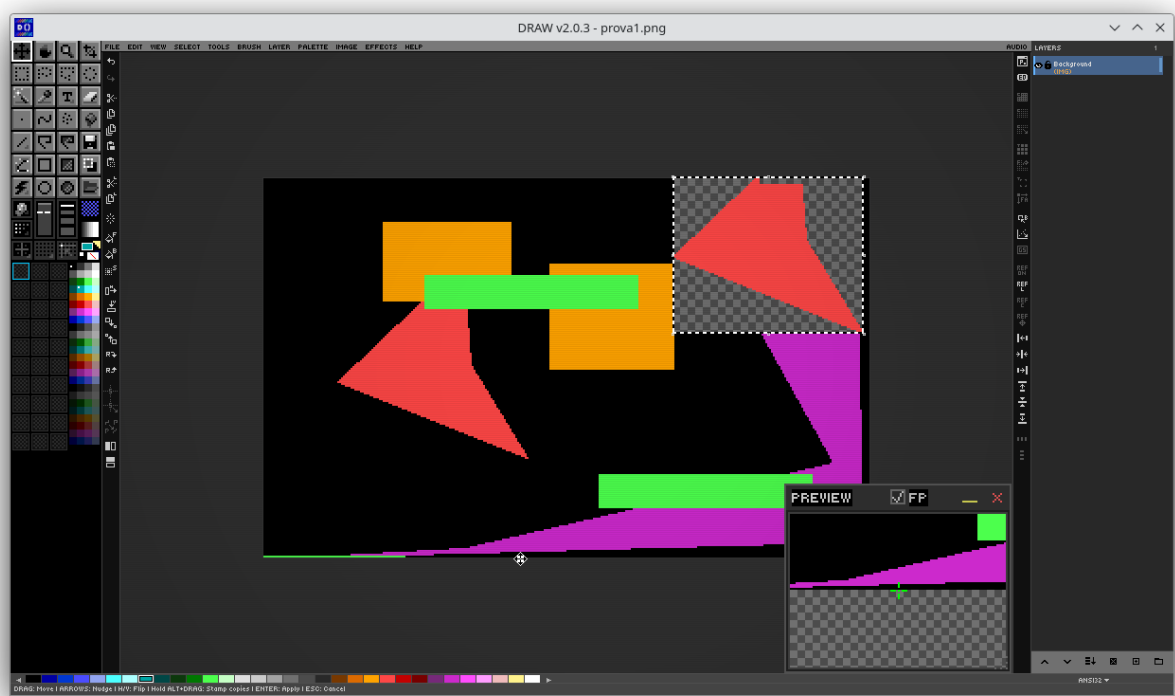

loading an image

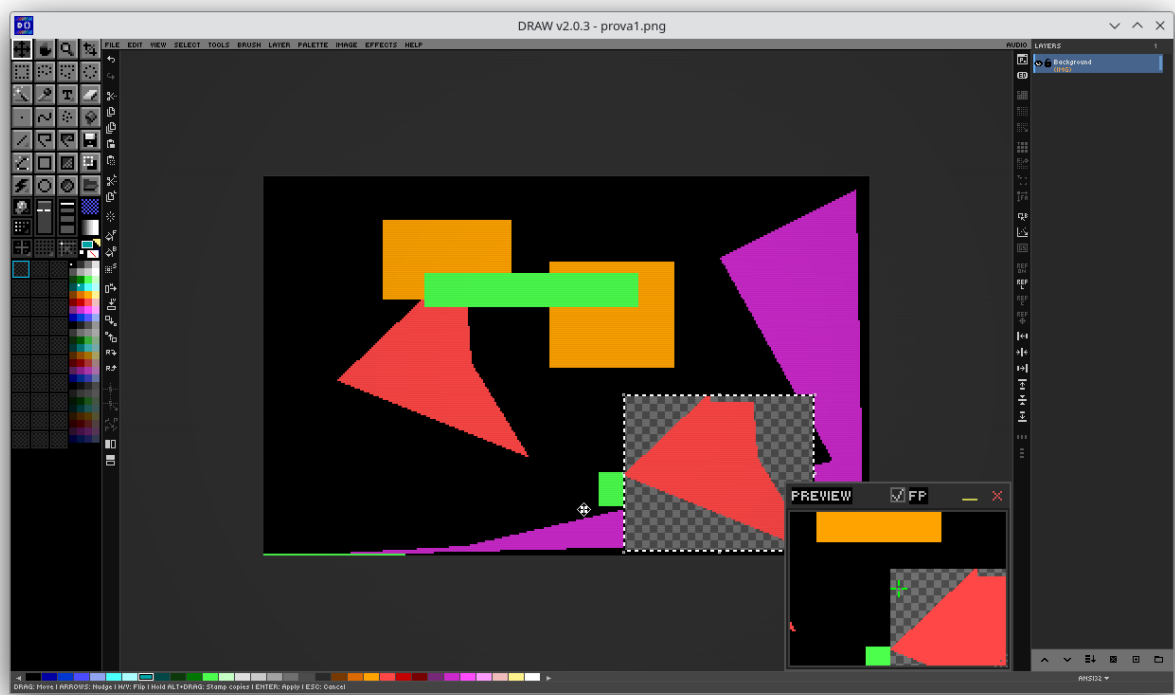

selecting a shape to copy and paste via **Magic Wand**

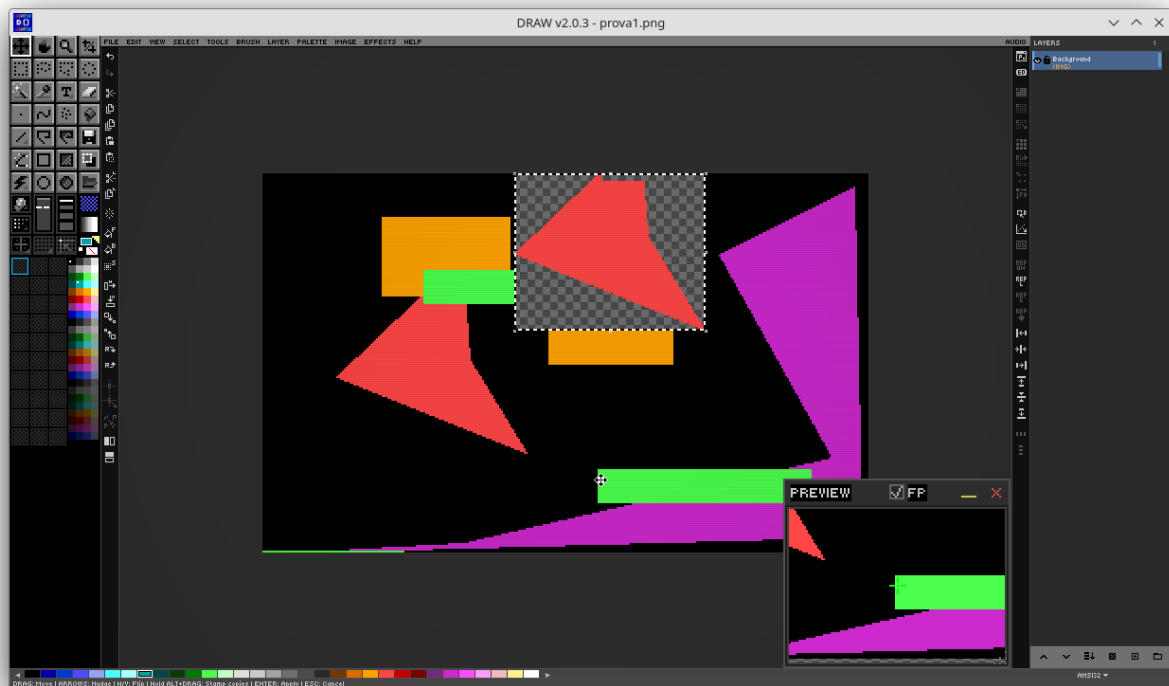

a first movement of the pasted shape

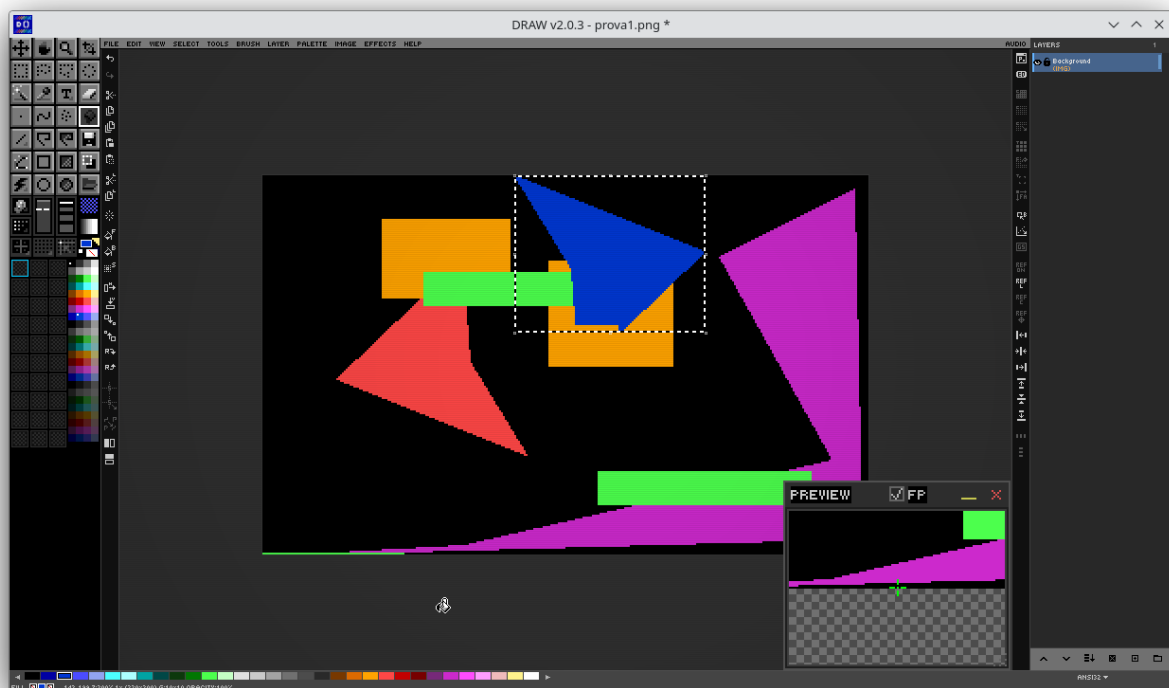

a second movement of the same copied shape

a third movement of the copied shape

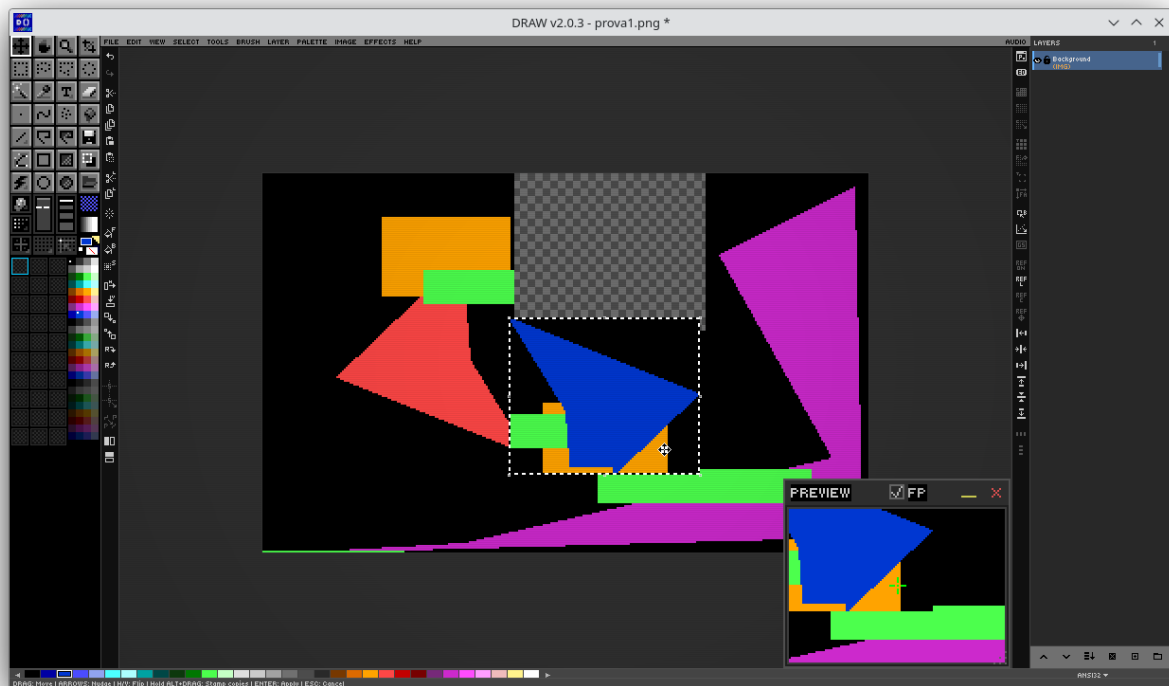

after flipping and coloring the shape it stands that square of selected area...

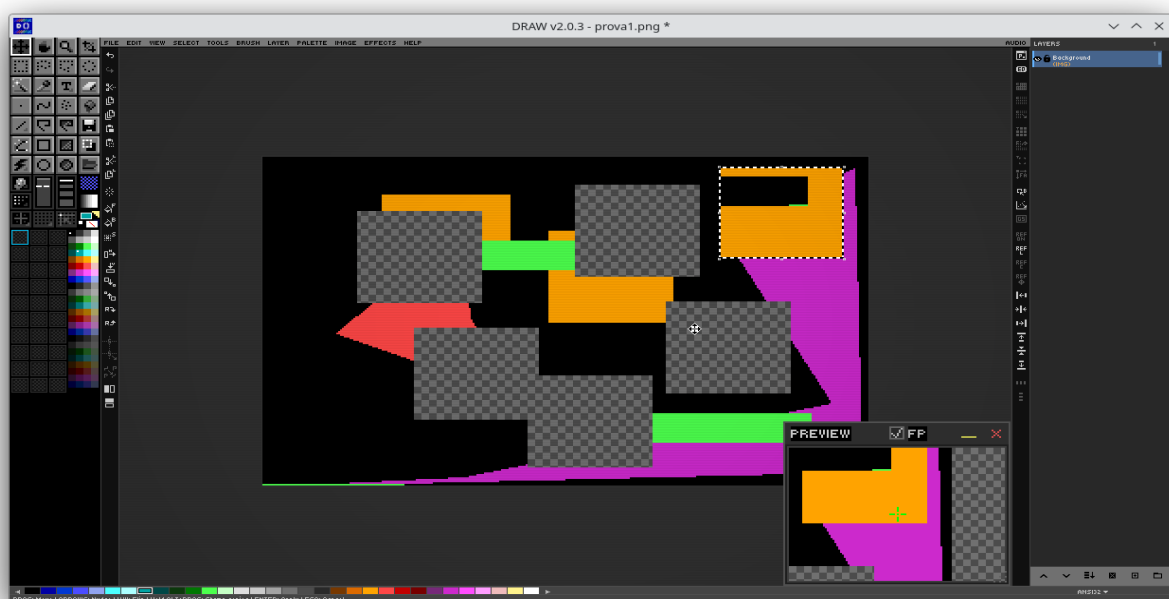

Current issue 1:

so if you make an further operation on the image „the effect is how you should decided to operate on a chosen area of the picture

What is the sequence or combokey to do for making null the selection area?

Here another screenshot for showing a good **Magic Wand** and a hard way to deselect it. After copying, pasting , if you make one click out of the selection area , then when you drag around the selected area these lasts stamps on the pictures.

Current issue2:

Open filebox is good but the name of file are not visible you must select it and then you can read the name on the bottom of this Open File Dialogbox.
